i Sequence 699316

i Sequence 69316, Application US/60427808

i GENERAL INFORMATION:

APPLICANT: Xue Mei Zhou

I TITE OF INVENTION: Methods of Genetic Analysis of Mouse

I TITE OF INVENTION: Methods of Genetic Analysis of Mouse

CURRENT APPLICATION NUMBER: US/60/427,808

CURRENT APPLICATION NUMBER: US/60/427,808

CURRENT APPLICATION NUMBER: US/60/427,808

CURRENT PILING DATE: 2022-11-20

NUMBER OF SEQ ID NOS: 982914

SOFTWARE: Microarray Probe Sequence Listing Generator V 1.1

SEQ ID NO 699316

LENGTH: 25

TYPE: DNA

ORGANISM: Mus musculus

                                                                                                                                                                                                                                                                                                                        //note="Vector: PMD42D19" Annified genomic DNA from M. musculus C57BL/6J (male) was obtained from the Jackson Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarcse gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (4) 4732114 (4) BAR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

```
(http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil 4732.114 [gb] AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100156H13F Mouse 10kb plasmid UUGCIM library Mus musculus genomic clone UUGCIM0156H13 F, DNA sequence.

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pw042 (gil/4732114 [gb]AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TITLE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                              (http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gol electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Eukaryota; Metazoa; Chordata; Sciurognathi; Muridae; Murinae; Mus. Submitted (17-JUN-2002) Weisshaar B., Max-Planck-Institut fuer Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany This sequence is recovered from the left border of the T-DNA. It indicates an insertion close to owithin gene At1907990. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI-Kat is part of the German availability can be found at:

/note="FCK was performed on DNA from Arabidopsis thaliana plants (TJ) which were transformed with the T-DNA from vector pAcisi. The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion. Sequences displaying significant similarity to the A. thalaina nuclear genome sequence processed for submission. T-DNA derived sequences were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BJ063841 NIBB Mochii normalized Xenopus tailbud library Xenopus

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 15

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Detecting telomerase activity in non-cellular body fluid using modified telomeric repeat amplification protocol

Disclosure; Page 16; 32pp; English

Ų

```
A method has been developed for detecting telomerase activity in a non-cellular portion of body fluid from a cancer patient using a modified telomeric repeat amplification protocol (TRAP). A method for detecting cancer comprises: (a) removing the cellular portion of a body fluid specimen from the patient; (b) preparing a protein extract from the body fluid remainder; (c) assaying the extract for the presence and quantity of telomerase RNA or telomerase activity; and (d) comparing the results with normal levels, to determine the presence of cancer. The methods are used in cancer diagnosis and prognosis, and also to monitor cancer therapy effectiveness. Unlike prior art telomerase activity assays in cancer patients, the method allows noninvasive sample collection. The methods are also more reliable and less tumour specific
 than other methods which detect circulating tumour markers. The present sequence represents a human telomerase RNA template PCR primer used in
 Gaps
 The present sequence, a nested PCR primer for the RNA component of human telomerase (RCHT), was used in a 5' RACE procedure. The RCHT can be used in the recombinant prodn. of an active telomerase mol., capable of adding sequences to chromosomal DNA telomeres, and in the synthesis of mutant sequences for the detection of mutant

The present sequence represents PCR 3'-primer R3C used for amplifying the human telomerase (hTR). The RNA and DNA can be used in hybridisation assays to detect or quantify telomerase activity in cells, tissue or fluid samples, e.g. for diagnosis of eukaryotic parasites (yeast and protozoa) or tumours. It is also useful as primers for amplification assays. The truncated or recombinant vertebrate telomerase is used therapeutically to increase telomerase activity (also as reagents in the screening assay) while the RNA or other inhibitors such as antisense molecules, are used to reduce such activity. Typical applications are initiation/restoration of activity to cause senescence
 directed against e.g. Trypanosoma should cause fewer side effects than drugs currently used to treat such infections. The DNA encodes those parts of hTR RNA essential for activity but are significantly shorter than the endogenous RNA component.
 or to prevent immortalisation of cells in tumours or parasites. The DNP is also used to produce recombinant telomerase, which can then be used conventionally to raise antibodies for diagnostic detection of telomerase. Detecting telomerase allows early diagnosis of tumour or infection, before clinical signs manifest. Telomerase inhibitors

The present sequence represents a PCR primer from the present invention which describes human telomerase reverse transcriptase (hTRT). The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polynucleotide, on administration of the compound; (B) preparation of recombinant telomerase by contacting a protein preparation of hTRT with a telomerase NNA component; (C) detection of the hTRT NNA or protein in a sample by binding a relevant probe to the sample and detecting the complex formed or in the case of NNA detection, amplifying the product and correlating the presence of complex or amplification product with presence of hTRT in the sample; and (D) increasing the product with presence of hTRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing hreuse of an agent that causes an increase in cell vertebrate cell proliferation to create a medicament that inhibits ageing. A protein preparation of hTRT and the polynucleotide encoding hTRT can be used in the manufacture of medicaments for inhibiting the used to treat conditions that are associated with high telomerase conditions that are associated with high telomerase
 Pure and recombinant human Telomerase Reverse Transcriptase and its variants - are useful in the diagnosis, prognosis and treatment of cell proliferation conditions especially cancer and ageing

 Human TPC2, TPC3 and TR genes - regulate telomere length or modulate
 Primers R3c and F3b (see AAV1948B) were designed for the PCR amplification of the human telomerase hTR gene (see AAV19481). hTR mRNA levels were showed to correlate with telomerase activity levels in a variety or mortal and immortal cell lines. Methods of the invention allow detection and quantitation of FPC2 (see AAV19479), TPC3 (see AAV19480) and/or TPC2 gene products and can be used to detect immortal cells, especially telomerase positive

This sequence represents a PCR primer for DNA encoding the human TPC3 protein, which is contained within the recombinant mammalian host cell of the invention. The invention provides methods and reagents for regulating telomere length and modulating telomerase activity in mammalian cells as well as for detecting, diagnosing, and treating related diseases and conditions such as cancer, pregnancy, or fertility in humans and other
telomerase activity (cf. WO 9735871). This sequence represents a primer used in the method of the invention.

The present invention describes a method (I) for detecting telomerase activity in a sample. The method comprises treating the sample with a solid phase to blind telomerase, separating the solid phase from the sample to form a test sample which may be treated to elute bound telomerase and assaying the sample for telomerase activity. Also described are: (I) a kit (II) for detecting telomerase activity, and (2) a component (III) of an assay system for telomerase activity; and (2) a component (III) of an assay system for detecting telomerase activity.

(comprising a solid phase and one or more components for assaying telomerase activity, comprising a solid phase for binding telomerase activity, comprising a solid phase for binding (1) is useful for cancer disgonsis or prognosis and detection of micrometastasis as detection of telomerase activity is indicative of cancer or micrometastasis. The solid phase used in (I) is useful for separating telomerase from a sample and therefore for detecting telomerase activity (II) is useful for detection of cancer cells and
 Detecting telomerase activity in samples, useful for diagnosis of cancer and micrometastasis, comprises treating sample with solid phase, removing solid phase and treating to elute bound telomerase

Human telomerase-associated RNA template (hTR), PCR primer hTR2.

Detecting human telomerase RNA template RNA or human telomerase reverse transcriptase protein RNA in bodily fluid, useful as marker for diagnosing, monitoring or treating cancer, carcinoma in situ or premalignancy -Human; telomerase-associated RNA template; hTR; endometrial; malignancy; cancer; breast; ovarian; head and neck; lung; cervical; colorectal; gastric; liver; pancreatic; bladder; prostate; brain; kidney; oesophagus; melanoma; acroma; premalignancy; carcinoma in-situ; cervical dysplasia; bronchial dysplasia; cervical intraepithehial neoplasia; atypical hyperplasia; colorectal adenoma; atypical endometrial hyperplasia; barrett's oesophagus; telomerase-directed therapy; primer; ss. 31-AUG-2000; 2000US-0653573. 28-AUG-2001; 2001WO-US26749. Gocke CD; (ONCO-) ONCOMEDX INC. WPI; 2002-269532/31. WO200218652-A2 Homo sapiens. Kopreski MS, 07-MAR-2002. 

The invention relates to detecting human telomerase RNA template (hTR)

RNA or human telomerase reverse transcriptase protein RNA (hTERT) RNA (1)

C an a bodily fluid, comprising amplifying RNA extracted from plasma or

serum sample, or its corresponding cDNA comprising (1), using primers or

c serum sample, or its corresponding cDNA comprising (1), using primers or

c probes that target (1) or cDNA and detecting qualitatively or

c probes that target (1) or cDNA and detecting qualitatively or

c quantitatively amplified product of (1) or cDNA product. The method is

c quantitatively amplified product of (1) or cDNA product. The method is

c defent for detecting (1) in a bodily fluid, which is useful for

c deneritying a human having (1) expressing cells or tissue which

c denerity corvical, colorectal, gastric, liver, pancreatic, bladder,

c prosestate, endometrial, brain, kidney, or oseophagus, or a melanoma or

c arccina, premalignancy or carcinoma in-situ, preferably cervical

dysplasia, cervical intraepithelial neoplasia, bronchial dysplasia,

colorectal adenoma, atypical endometrial hyperplasia, or Barret's

colorectal adenoma, atypical endometrial hyperplasia, or carcinoma

in situ. The method is a risk for developing a malignancy or

carcinoma in situ. The method is a lao useful for treating a human with malignancy or premalignancy

condition is utilised as a guide to owhere adenominal endometrial in a human with malignancy or premalignancy

and for monitoring a therapy administered to a human. (1) provides a

need for diagnostic test in a human with malignancy and varietical procedures to remove premalignancy enditatively, of (1) in plasma or serum of human grown premaligna relages, or treatment failure. The method allows the development and application of telomerase-specific therapy even when only premalignant tumours, early cancer, or occult cancer or metastasts such as following resection or in minimal residual disease are present. The present sequence represents a PCR primer for human telomerase-associated

Sequence 26 BP; 7 A; 3 C; 9 G; 7 T; 0 other;

RNA template (hTR).

```

0
 The invention relates to methods and reagents for regulating telomere length and for modulating telomerase activity in mammalian cells. The invention also relates to purified, synthetic or recombinant peptides such as TPC2 or TPC3 used for detecting regulators of telomere length and telomerase activity in mammalian cells and for a variety of related diagnostic and therapeutic purposes. The method is useful for screening, diagnostic, many monitoring and treating diseases and other conditions such as cancer, pregnancy, fertility, telomere length and telomerase-activity. The present sequence is a reverse transcription (RT) PCR primer used for amplifying human telomerase (hTR) cDNA.
 Peptide products of the human TPC2 and TPC3 gene are involved in regulation of telomere length and activity are useful to diagnose and treat telomere length and activity-related diseases -

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a no.05 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWMs2 (gil473214 |gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to

 30 bp mRNA linear EST 25-APR-2002
BED0011024 3', mRNA sequence.
 Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (Trypanosoma brucei distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Maxing small insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Osford University Press, 1999).

A method has been developed for detecting telomerase activity in a non-cellular portion of body fluid from a cancer patient using a modified telomeric repeat amplification protocol (TRAP). A method for detecting cancer comprises: (a) removing the cellular portion of a body fluid specimen from the patient; (b) preparing a protein extract from the body fluid remainder; (c) assaying the extract for the presence and quantity of telomerase RNA or telomerase activity; and (d) comparing the results with normal levels, to determine the presence of cancer. The methods are used in cancer diagnosis and prognosis, and also to monitor cancer therapy effectiveness. Unlike prior art telomerase activity assays in cancer patients, the method allows noninvasive sample collection. The methods are also more reliable and less tumour specific than other methods which detect circulating tumour markers. The present sequence represents a human telomerase RNA template FCR primer used in

 Sequences shown in AAV41169 to AAV41181 represent antisense
oligonucleotides to the RNA component of human telomerase (HTR). These
antisense oligonucleotides specifically hybridise to a nucleotide
sequence within an accessible region of the hTR, but that does not
bybridise to a sequence within the template region of hTR. These
component of human telomerase in a sample. This is useful for diagnosing
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
and providing prognosis for a cancer patient. The inhibitors
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
and providing prognosis for a cancer patient. The inhibitors
interfering with transcription of the RNA component, decreasing the
interfering with transcription of the RNA component, decreasing the
interfering with transcription of the RNA component, decreasing the
clief of the telomerase RNA component transcript, inhibiting assembly
of the RNA component into the telomerase holoenzyme, or inhibiting the
polymerase activity of telomerase. These antisense oligonucleotides can
be used for inhibiting telomerase activity in both cultured cells and in
cells in vivo. They can be used in therapeutics for treating or
preventing cancer, for contraception or sterilisation, for
immunosuppression, and for selectively down-regulating specific branches
of the immune system, e.g. a specific subset of T-cells, in

 The RNA components of (non) human mammalian telomerase(s) especially from mouse, rat and chinese hamster are all claimed. Antisense oligonucleotides can be used to block the activity of the telomerase; probes and primers can be used in detection; vectors and host cells transformed with the isolated telomerase genes can be used for production of telomerases; RNA and DNA ribozymes and triplex forming oligonucleotides directed against the telomerase genes can be used therapeutically as can plasmids. A mouse which lacks the telomerase gene (also claimed) can be used for study of telomere regulation in vivo, and the role it plays in immortalisation. Three primers (AATI1040, AATI1044) where then used to produce antisense expression plasmids. AATI1040 was used alongside both AATI1043 and

 The present sequence represents PCR 3'-primer R3C used for amplifying the human telomerase (hTR). The RNA and DNA can be used in hybridisation assays to detect or quantify telomerase activity in cells, tissue or fluid samples, e.g. for diagnosis of eukaryotic parasites (yeast and protozoa) or tumours. It is also useful as primers for amplification assays. The truncated or recombinant vertebrate telomerase is used therapeutically to increase telomerase activity (also as reagnts in the screening assay) while the RNA or other inhibitors such as antisense molecules, are used to reduce such activity. Typical applications are initiation/restoration of activity to cause senescence
 or to prevent immortalisation of cells in tumours or parasites. The DNA is also used to produce recombinant telomerase, which can then be used conventionally to raise antibodies for diagnostic detection of telomerase. Detecting telomerase allows early diagnosis of tumour or infection, before clinical signs manifest. Telomerase inhibitors
 directed against e.g. Trypanosoma should cause fewer side effects than drugs currently used to treat such infections. The DNA encodes those parts of hTR RNA essential for activity but are significantly shorter
 DNA encoding essential RNA components of human telomerase - also truncated or recombinant telomerase, useful for diagnosis and treatment of cancer and infection by eukaryotic parasites

Primers R3c and F3b (see AAV19488) were designed for the PCR amplification of the human telonerase hTR gene (see AAV19481). hTR mRNA levels were showed to correlate with telomerase activity levels in a variety or mortal and immortal cell lines. Methods of the invention allow detection and quantitation of TPC2 (see AAV19480) and/or TPC2 gene products and can be used to detect immortal cells, especially telomerase positive

The present invention describes a method (I) for detecting telomerase activity in a sample. The method comprises treating the sample with a solid phase to bind telomerase, separating the solid phase from the sample to form a test sample which may be treated to elute bound telomerase and assaying the sample for telomerase activity. Also described are: (I) a kit (I) for detecting telomerase activity. Also comprising a solid phase and one or more components for assaying telomerase activity, comprising a solid phase for binding telomerase activity, comprising a solid phase for binding telomerase activity, comprising a solid phase for binding telomerase on which is present a substrate for telomerase elongation.

(I) is useful for cancer diagnosis or prognosis and detection of micrometeastasis. The solid phase activity is indicative of cancer or micrometeastasis. The solid phase used in (I) is useful for separating telomerase from a sample and therefore for detecting telomerase activity. (II) is useful for detecting cancer cells and may also comprises means for assaying an mRNA diagnostic for cancer.

The present sequence represents a reverse transcriptase (RT) PCR primer

can be used for inhibiting telomerase activity in both cultured cells and in cells in vivo. They can be used in therapeutics for treating or preventing cancer, for contraception or sterilisation, for immunosuppression, and for selectively down-regulating specific branches of the immune system, e.g. a specific subset of T-cells, in anti-inflammatory therapies or for treating infections by, e.g. yeast, parasites or fungi.
 This primer is used for the RT-PCR amplification of an RNA component of human telomerase (hTR). This is used in the method of invention of determining the amount of hTR in a sample. The method comprises amplifying a sequence of hTR and a control polynucleotide from a sample and determining an amount of amplified hTR and an amount of amplified are control polynucleotide. The amount of amplified hTR is normalised with respect to the amount of ATR which provides a determination of the amount of hTR which provides a determination of the amount of hTR which may specifically be used for detection of an RNA component the hTR which may specifically be used for detection of an RNA component of human telomerase in a sample. This is useful for diagnosing cancer (especially neuroblastoma, bladder, colon and prostate cancer), and providing prognosis for a cancer patient. The antisense oligonucleotides providing prognosis for a cancer patient.
